<p>PROOF</p> <p><i>Mean Value Theorem</i></p>	<p>DEFINITION</p> <p><i>Lipschitz Condition</i></p>
<p>THEOREM</p> <p><i>Ratio Mean Value Theorem</i></p>	<p>EXAMPLE</p> <p><i>A function satisfying the lipschitz condition</i></p>
<p>EXAMPLE</p> <p><i>Discontinuity of the second kind</i></p>	<p>DEFINITION</p> <p><i>r-th order differenitable at x.</i></p>
<p>DEFINITION</p> <p><i>Darboux continuous</i></p>	<p>THEOREM</p> <p><i>Continuity of the derivative of a differentiable function</i></p>

<p>A continuous function $f : [a, b] \rightarrow \mathbb{R}$ which is differentiable on (a, b) has the mean value property: there exists a $\theta \in (a, b)$ such that</p> $f(b) - f(a) = f'(\theta)(b - a).$	<p>The function $f : (a, b) \rightarrow \mathbb{R}$ is differentiable at x iff</p> $\lim_{t \rightarrow x} \frac{f(t) - f(x)}{t - x} = L$ <p>exists.</p>
<p>$f : M \rightarrow N$ satisfies the lipschitz condition if and only if there exists a K such that</p> $d(fx, fy) \leq Kd(x, y)$	<p>Take $f(x) - \frac{f(b)-f(a)}{b-a}(x-a) = g(x)$. Then $g(x)$ attains a maximum or a minimum on $[a, b]$ by its continuity. At either the min or max, $\theta \in (a, b)$. Then $g'(\theta) = 0$. Therefore $f'(\theta) = S$. <i>Draw the secant line!</i></p>
$f(x) = Kx.$ $ f(x)' \leq K$	<p>Let $f, g : [a, b] \rightarrow \mathbb{R}$ be continuous functions. Then there exists a $\theta \in (a, b)$ such that</p> $\frac{f'(\theta)}{g'(\theta)} = \frac{\Delta f}{\Delta g}$
<p>The function f is r-th order differentiable at x if and only if it is differentiable up to r and $f^{(r-1)}$ is continuous.</p>	$f(x) = x^2 \sin\left(\frac{1}{x}\right), f(0) = 0$
<p>If f is differentiable on (a, b) then its derivative is Darboux continuous.</p>	<p>A function which possesses the intermediate value property.</p>

<div>DEFINITION</div> <div><i>Smooth function</i></div>	<div>DEFINITION</div> <div><i>Analytic function</i></div>
<div>EXAMPLE</div> <div><i>Nonanalytic Smooth Function</i></div>	

<p> $f : (a, b) \rightarrow \mathbb{R}$ is analytic if for each $x \in (a, b)$ there is a power series </p> $\sum a_r h^r$ <p> and a $\delta > 0$ such that if $h < \delta$ then </p> $f(x + h) = \sum_{r=0}^{\infty} a_r h^r$	<p> A function $f : (a, b) \rightarrow \mathbb{R}$ is smooth if and only if it is infiniteley differentiable. </p>
